Chapter 1. Introduction

Welcome to the DistroTV Studio Getting Started Guide.

DistroTV Studio allows you to build a full-suite linear streaming HLS channel equipped with ad markers and accompanying EPG.

The purpose of this document is to provide a complete, hands-on walkthrough for launching your first FAST channel using the sample content provided.

In this guide, you will learn how to:

- Correctly configure the necessary AWS services, including an S3 Bucket, IAM permissions, and Security Groups.
- Launch and initialize the DistroTV Studio and DistroTV Studio Transcoder EC2 instances from AWS Marketplace AMIs.
- Ingest sample video metadata and set up a basic channel schedule.
- Launch and verify that your first channel is live and streaming.
- By the end of this guide, you will have a functional FAST channel with ad break markers and the foundational knowledge to begin building custom channels with your own media. For advanced configurations and detailed instructions on using your own content, please refer to our comprehensive **User Guide**.

Prerequisites

Before you begin, you should have:

- An active AWS account with permissions to create S3 buckets, IAM roles and policies, and EC2 instances.
- Basic familiarity with navigating the AWS Management Console.

Chapter 2. Setting Up the AWS Environment

1. Creating an S3 Bucket

- Open AWS console and navigate to **S3** service
- Click **“Create a bucket”** button

Create a bucket

Every object in S3 is stored in a bucket. To upload files and folders to S3, you'll need to create a bucket where the objects will be stored.

Create bucket

- Apply the following settings:(if an option is not mentioned, keep it on the default value)
 - Bucket type: **“General purpose”**
 - Object Ownership: **“ACLs enabled”**
 - Uncheck **“Block all public access”**
 - Check **“I acknowledge that the current settings might result in this bucket and the objects within becoming public.”**
- Click **“Create Bucket”** button
- **Note the name of your bucket as you will be using this in later steps.**

General configuration

AWS Region

US West (Oregon) us-west-2

Bucket type | Info

☒ **General purpose**
Recommended for most use cases and access patterns. General purpose buckets are the original S3 bucket type. They allow a mix of storage classes that redundantly store objects across multiple Availability Zones.

☐ **Directory**
Recommended for low-latency use cases. These buckets use only the S3 Express One Zone storage class, which provides faster processing of data within a single Availability Zone.

Bucket name | Info

distroTV-studio-getting-started (choose your own unique name)

Bucket names must be 3 to 63 characters and unique within the global namespace. Bucket names must also begin and end with a letter or number. Valid characters are a-z, 0-9, periods (.), and hyphens (-). [Learn More](#) 

Object Ownership [Info](#)

Control ownership of objects written to this bucket from other AWS accounts and the use of access control lists (ACLs). Object ownership determines who can specify access to objects.

☐ **ACLs disabled (recommended)**

All objects in this bucket are owned by this account. Access to this bucket and its objects is specified using only policies.

☒ **ACLs enabled**

Objects in this bucket can be owned by other AWS accounts. Access to this bucket and its objects can be specified using ACLs.

We recommend disabling ACLs, unless you need to control access for each object individually or to have the object writer own the data they upload. Using a bucket policy instead of ACLs to share data with users outside of your account simplifies permissions management and auditing.

Object Ownership

☒ **Bucket owner preferred**

If new objects written to this bucket specify the bucket-owner-full-control canned ACL, they are owned by the bucket owner. Otherwise, they are owned by the object writer.

☐ **Object writer**

The object writer remains the object owner.

Block Public Access settings for this bucket

Public access is granted to buckets and objects through access control lists (ACLs), bucket policies, access point policies, or a canned ACL. These settings apply only to this bucket and its access points. AWS recommends that you turn on Block all public access. If you require some level of public access to this bucket or objects within, you can customize the individual settings.

☐ **Block all public access**

Turning this setting on is the same as turning on all four settings below. Each of the following settings are independent of one another.

☐ **Block public access to buckets and objects granted through *new* access control lists (ACLs)**

S3 will block public access permissions applied to newly added buckets or objects, and prevent the creation of new public access ACLs resources using ACLs.

☐ **Block public access to buckets and objects granted through *any* access control lists (ACLs)**

S3 will ignore all ACLs that grant public access to buckets and objects.

☐ **Block public access to buckets and objects granted through *new* public bucket or access point policies**

S3 will block new bucket and access point policies that grant public access to buckets and objects. This setting doesn't change any existing policies.

☐ **Block public and cross-account access to buckets and objects through *any* public bucket or access point policies**

S3 will ignore public and cross-account access for buckets or access points with policies that grant public access to buckets and objects.

Turning off block all public access might result in this bucket and the objects within becoming public

AWS recommends that you turn on block all public access, unless public access is required for specific and verified use cases.

☒ I acknowledge that the current settings might result in this bucket and the objects within becoming public.

2. Edit Bucket Permissions

- Navigate to the S3 bucket you just created
- Select the “**Permissions**” tab to configure its access settings.
- In the “**Permissions**” tab, scroll down to “**Cross-origin resource sharing (CORS)**”
- Select “**Edit**” in the top right of the **CORS** box
- Paste the following into the text box

```
[
  {
    "AllowedHeaders": [
      "*"
    ],
    "AllowedMethods": [
      "GET",
      "HEAD"
    ],
    "AllowedOrigins": [
      "*"
    ],
    "ExposeHeaders": [],
    "MaxAgeSeconds": 3000
  }
]
```

- Click “**Save changes**” button
- Consider leaving this AWS S3 tab open in your browser as you will need to reference your bucket name in the following steps

 [Amazon S3](#) > [Buckets](#) > distroTV-studio-getting-started

Chapter 3. Access Management Setup

1. Create a New IAM Policy

- Open AWS console and navigate to **IAM** service
- Navigate to “**Policies**” menu item under the “**Access management**” on the left menu

▼ Access management

User groups

Users

Roles

Policies

Identity providers

Account settings

Root access management [New](#)

- Click on “**Create policy**”

Policies (1354) [Info](#)

Actions ▼

Delete

Create policy

A policy is an object in AWS that defines permissions.

- In the “**Policy selector**”, select the “**JSON**” tab

- Edit statement and paste the following JSON, ensuring you replace the **bucket name** with the actual name of the S3 bucket you created in Chapter 2

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "s3:ListBucket",
        "s3:GetObject",
        "s3:PutObject",
        "s3:PutObjectAcl",
        "s3:DeleteObject"
      ],
      "Resource": [
        "arn:aws:s3:::<bucket name>",
        "arn:aws:s3:::<bucket name>/*"
      ]
    }
  ]
}
```

Specify permissions [Info](#)

Add permissions by selecting services, actions, resources, and conditions. Build permission statements using the JSON editor.

Policy editor

Visual **JSON** Actions 

```
1 {
2   "Version": "2012-10-17",
3   "Statement": [
4     {
5       "Effect": "Allow",
6       "Action": [
7         "s3:ListBucket",
8         "s3:GetObject",
9         "s3:PutObject",
10        "s3:PutObjectAcl",
11        "s3:DeleteObject"
12      ],
13      "Resource": [
14        "arn:aws:s3::.<bucket name>",
15        "arn:aws:s3::.<bucket name>/*"
16      ]
17    }
18  ]
19 }
```

Edit statement

Select a statement
Select an existing statement in the policy or add a new statement.
[+ Add new statement](#)

- Save by clicking the “**Next**” button
- Name this “**distroTV-studio-policy**”, or another name of your choice, then click “**Create policy**” button

Policy details

Policy name

Enter a meaningful name to identify this policy.

Policies

Identity providers

Account settings

Root access management [New](#)

- Click on “**Create role**” button

Roles (4) [Info](#)

Delete

Create role

- For “**Trusted entity type**”, ensure “**AWS service**” is selected
- Under “**Use case**”, select the “**EC2**” radio button option

Trusted entity type

☒ **AWS service**

Allow AWS services like EC2, Lambda, or others to perform actions in this account.

☐ **AWS account**

Allow entities in other AWS accounts belonging to you or a 3rd party to perform actions in this account.

☐ **Web identity**

Allows users federated by the specified external web identity provider to assume this role to perform actions in this account.

☐ **SAML 2.0 federation**

Allow users federated with SAML 2.0 from a corporate directory to perform actions in this account.

☐ **Custom trust policy**

Create a custom trust policy to enable others to perform actions in this account.

Use case

Allow an AWS service like EC2, Lambda, or others to perform actions in this account.

Service or use case

EC2

Choose a use case for the specified service.

Use case

☒ **EC2**

Allows EC2 instances to call AWS services on your behalf.

- Click on **“Next”** button
- Add permissions: In the **“Permissions policies”** search box, search for the policy you created in Step 1 (e.g., `distroTV-studio-policy` or the name you chose). Check the box next to this policy to select it.

Add permissions [Info](#)

Permissions policies (1/1058) [Info](#)

Choose one or more policies to attach to your new role.

 - Under “**Role name**” box “**Name**” section, enter ‘**distrotv-studio-role**’ or another name of your choice
 - Description can also be left default or changed to your liking.

Name, review, and create

Role details

Role name
Enter a meaningful name to identify this role.

Maximum 64 characters. Use alphanumeric and '+=,.,@-_' characters.

- Click on “**Create role**” button

Chapter 4. Create a Global Conf File

The global conf file is a configuration file which helps point the DistroTV Studio AMI to access the correct public S3 directories for files.

It takes 4 required parameters:

s3_meta is the folder where the channel configuration files are being placed.

s3_output is the folder where the m3u8s and ts files will be uploaded. they will be uploaded into this folder /strm/ for linear and built channels and in /vid/ for content generated by the DistroTV Studio Transcoder.

s3_transcode is the folder where the preramp will communicate with the DistroTV Studio Transcoder when new videos are to be encoded.

channel_list are the names of the configuration files the DistroTV Studio AMI will scan for within your S3 directory. In this guide we assume the names of the channel files will be myfirstchannel_preramp and myfirstchannel.

1. Create Global Conf File

- Download the sample global conf file here and be sure to replace the **<bucket name>** with your bucket:

https://docs.distro.tv/samples/channel-builder/globals/global_1.conf

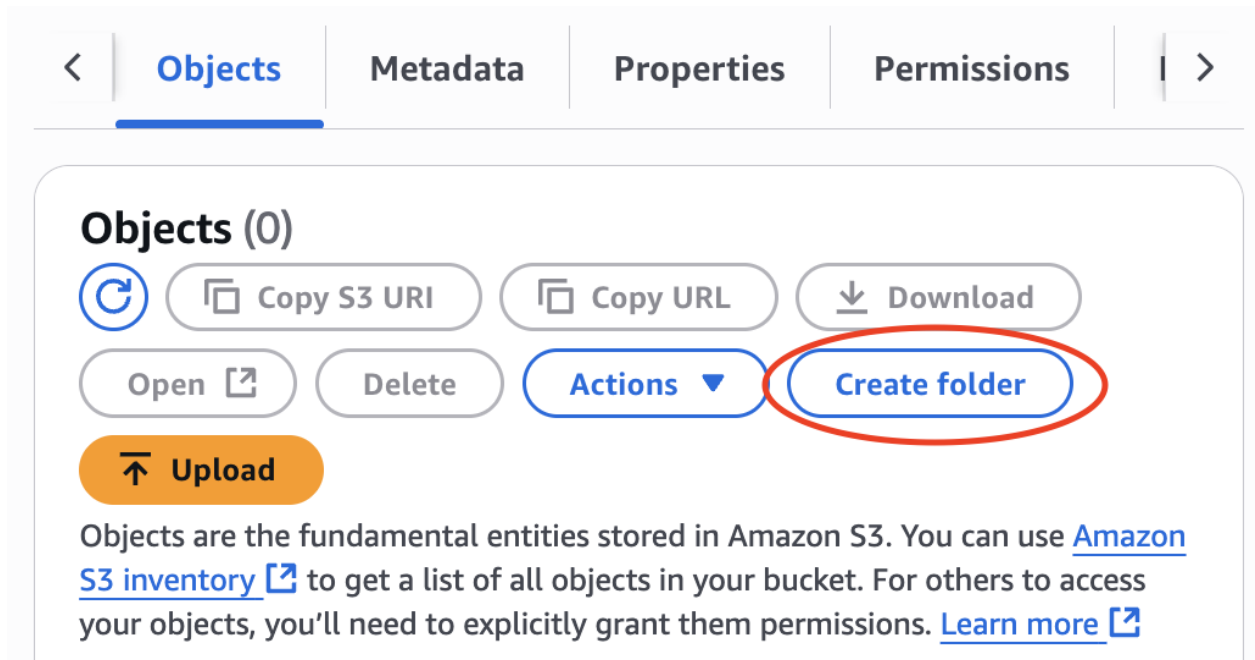

- HINT: After opening the link, right-click the page and 'Save As' **global_1.conf**

```
[General]
s3_meta=s3://<bucket name>/meta/
s3_output=s3://<bucket name>/
s3_transcode=s3://<bucket name>/transcode/
channel_list=myfirstchannel_preramp,myfirstchannel
```

- Edit the file and be sure to replace the **<bucket name>** with your bucket
 - Note: the /meta/ and /transcode/ folders will be created in later steps
- Save the file as “**global_1.conf**” on your local machine. You will be uploading this file in a later step.

2. Create globals Folder

- Open AWS console and navigate to **S3** service and navigate to the bucket you created in Chapter 1 (root folder)
- Click on “**Create folder**” button

- Under “Folder” box “Folder name” section, name this “**globals**”

Folder

Folder name

globals

Folder names can't contain "/".

- Create a **globals** folder inside the path defined in the **s3_output** folder.
 - If you kept the default filepath from the sample global conf file, the file directory path would be
s3://<bucket name>/globals/

3. Upload Your Global Conf File

- Upload the global conf file you just created to your S3 bucket **/globals/** folder.

Chapter 5. Creating S3 Bucket Directories

- In your S3 bucket, ensure that the folders & directories listed in your global conf file exist
 - `s3_meta=s3://<bucket name>/meta/`
 - `s3_output=s3://<bucket name>/`
 - `s3_transcode=s3://<bucket name>/transcode/`
 - If they do not exist, create them and name them according to how you defined the paths in your global conf file by following the steps below

1. Create **meta** Folder

- Navigate to your S3 bucket root folder
- Click on “**Create folder**” button
- Under “**Folder**” box “**Folder name**” section, name this “**meta**”
 - If you kept the default filepath from the sample global conf file, the file directory path would be
`s3://<bucket name>/meta`
- Click on “**Create folder**” button

2. Create **transcode** Folder

- Navigate to your S3 bucket root folder
- Click on “**Create folder**” button
- Under “**Folder**” box “**Folder name**” section, name this “**transcode**”
 - If you kept the default filepath from the sample global conf file, the file directory path would be
`s3://<bucket name>/transcode`
- Click on “**Create folder**” button

3. Create **content** Folder

- Navigate to your S3 bucket root folder
- Click on “**Create folder**” button
- Under “**Folder**” box “**Folder name**” section, name this “**content**”
 - If you kept the default filepath from the sample global conf file, the file directory path would be
`s3://<bucket name>/content/`
- Click on “**Create folder**” button

4. Create **channels** Folder

- Navigate to your S3 bucket **meta** folder
- Click on “**Create folder**” button

- Under “**Folder**” box “**Folder name**” section, name this “**channels**”
 - If you kept the default filepath from the sample global conf file, the file directory path would be
s3://<bucket name>/meta/channels/
- Click on “**Create folder**” button

5. Create **schedule** Folder

- Navigate to your S3 bucket **meta** folder
- Click on “**Create folder**” button
- Under “**Folder**” box “**Folder name**” section, name this “**schedule**”
 - If you kept the default filepath from the sample global conf file, the file directory path would be
s3://<bucket name>/meta/schedule/
- Click on “**Create folder**” button

After this chapter, your S3 bucket should have the following structure:

```
<bucket-name>/
├── content/                                (Created in Chapter 5)
├── globals/                               (Created in Chapter 4)
│   └── global_1.conf                       (Uploaded in Chapter 4)
├── meta/                                  (Created in Chapter 5)
│   ├── channels/                          (Created in Chapter 5)
│   └── schedule/                          (Created in Chapter 5)
└── transcode/                             (Created in Chapter 5)
```

Chapter 6. Launch a DistroTV Studio Image

- Navigate to **AWS EC2** service
- Navigate to “**AMI Catalog**” menu item under the “**Images**” section on the left menu
- Navigate to “**AWS Marketplace AMIs**” and search for “**DistroTV Studio**”

The screenshot shows the AWS Marketplace AMIs search results for 'DistroTV Studio'. The search bar at the top contains 'DistroTV Studio'. Below the search bar, there are four tabs: 'Quick Start AMIs (0)', 'My AMIs (5)', 'AWS Marketplace AMIs (2)', and 'Community AMIs (500)'. The 'AWS Marketplace AMIs (2)' tab is selected. On the left side, there is a 'Refine results' section with filters for Categories, Publisher, Pricing model, Operating system, Contract type, and Architecture. The main results area shows two results for 'DistroTV Studio'. The first result is 'DistroTV Studio Transcoder' by DistroScale, Inc., version v0.2, with a 'Select' button. The second result is 'DistroTV Studio' by DistroScale, Inc., version v0.3, with a 'Select' button. The second result is highlighted with a red border.

- “User data - optional” (near the bottom of the options)
 - Add the following line being sure to reference your S3 file path or publicly accessible URL that stores the global conf file(s)

```
globals=s3://<bucket name>/globals/global_1.conf
```

User data - optional | [Info](#)

Upload a file with your user data or enter it in the field.

 **Choose file**

`globals=s3://<bucket name>/globals/global_1.conf`

- Click on “**Launch instance**” button
- After waiting 2-3 minutes, validate the machine is up and running by connecting to the API
 - Open a browser and go to your EC2 instance’s API log, being sure to replace `<your-instance-public-IPv4>` with your newly launched EC2 instance’s Public IPv4 address: `http://<your-instance-public-IPv4>:34123/?version`

Chapter 7. Ingest Content

1. Create a Metadata File

- Download the sample TSV here:
https://docs.distro.tv/samples/channel-builder/content/test_category_metadata.tsv
- Or if you wish to do your first channel build with your own content, then you can create a sample content metadata file for ingest by following the Excel template found below. Populate the spreadsheet with your own content details and **save as a TSV file with the name test_category_metadata.tsv**. You can find additional details in our **User Guide**.
<https://docs.distro.tv/samples/channel-builder/content/DistroTV%20-%20Channel%20Content%20Sample%20Metadata%20Template.xlsx>
- Upload **test_category_metadata.tsv** to a publicly accessible location, we recommend the S3 bucket you just created for this purpose in the content folder.
 - If you kept the default filepath from the sample global conf file, the file path would be **s3://<bucket name>/content/test_category_metadata.tsv**

2. Create a Preramp Conf File

- Create a channel_preramp conf file by downloading the sample preramp conf file here being sure to **edit and replace** **<HTTPS URL or S3 FILE PATH TO test_category_metadata.tsv>** with your S3 file path or publicly accessible file URL:
https://docs.distro.tv/samples/channel-builder/meta/channels/myfirstchannel_preramp.conf
- Save as **myfirstchannel_preramp.conf**.
 - HINT: Preramp files must have the **_preramp.conf** suffix in the file name.
- Upload this file to your **/channels/** folder inside the path defined in the **s3_meta** folder.
 - If you kept the default filepath from the sample global conf file, the file directory path would be **s3://<bucket name>/meta/channels/**
- After uploading, you can wait 2-3 minutes to see if the channel_preramp conf file was picked up by the machine by checking the watchdog API at:
http://<your-instance-public-IPv4>:34123/?cmd=getlog&channel=watchdog&grep=

It should say something similar to the following

```
myfirstchannel_preramp: no conf file found on current configuration, added...

Chapter 8. Launch a DistroTV Studio Transcoder Image

- Navigate to **AWS EC2** service
- Navigate to “**AMI Catalog**” menu item under the “**Images**” section on the left menu
- Navigate to “**AWS Marketplace AMIs**” and search for “**DistroTV Studio Transcoder**”

The screenshot shows the AWS Marketplace AMIs search results for 'DistroTV Studio'. The search bar at the top contains 'DistroTV Studio'. Below the search bar, there are four tabs: 'Quick Start AMIs (0)', 'My AMIs (5)', 'AWS Marketplace AMIs (2)', and 'Community AMIs (500)'. The 'AWS Marketplace AMIs (2)' tab is selected. On the left side, there is a 'Refine results' section with filters for Categories, Publisher, Pricing model, Operating system, Contract type, and Architecture. The main results area shows two items, both titled 'DistroTV Studio Transcoder'. The first item is highlighted with a red box and has a 'Select' button. The second item is also titled 'DistroTV Studio Transcoder' and has a 'Select' button. The description for both items is: 'DistroTV Studio is the fastest path from video library to fully monetizable FAST channel on AWS. Built by DistroScale. The creators of DistroTV, the world's largest independent FAST platform. Studio automates every technical step so content owners can focus on programming, branding, and revenue....'

- Select the **DistroTV Studio Transcoder** image and click on “**Subscribe now**”

DistroTV Studio Transcoder

- Key pair
 - Choose your preferred key pair
- Network settings
 - Check the following:
 - Allow CUSTOMTCP traffic from (Anywhere)

▼ Network settings [Info](#)

[Edit](#)

Network [Info](#)

vpc-042871955e5e89e30

Subnet [Info](#)

No preference (Default subnet in any availability zone)

Auto-assign public IP [Info](#)

Enable

Additional charges apply when outside of free tier allowance

Firewall (security groups) [Info](#)

A security group is a set of firewall rules that control the traffic for your instance. Add rules to allow specific traffic to reach your instance.

☒ Create security group

☐ Select existing security group
We'll create a new security group called '**DistroTV Studio Transcoder-v0.2-AutogenByAWSMP--1**' with the following rules:
☒ Allow CUSTOMTCP traffic from

Recommended rule from AMI

Anywhere

0.0.0.0/0

☐ Allow HTTPS traffic from the internet

To set up an endpoint, for example when creating a web server

☐ Allow HTTP traffic from the internet

To set up an endpoint, for example when creating a web server

⚠ Rules with source of 0.0.0.0/0 allow all IP addresses to access your instance. We recommend setting security group rules to allow access from known IP addresses only.

✕

- Under the “**Advanced details**” box
 - IAM instance profile
 - Select the role you created earlier (**distroTV-studio-role** if you followed the naming convention in the Chapter 2)

▼ Advanced details [Info](#)

Domain join directory [Info](#)

[Create new directory](#)

IAM instance profile [Info](#)

distroTV-studio-role

arn:aws:iam::[redacted]:role/distroTV-studio-role

[Create new IAM profile](#)

- “User data - optional” (near the bottom of the options)
 - Add the following line being sure to reference your S3 file path or publicly accessible URL that stores the global conf file(s)

```
globals=s3://<bucket name>/globals/global_1.conf
```

User data - optional | [Info](#)

Upload a file with your user data or enter it in the field.

↑ Choose file

globals=s3://<bucket name>/globals/global_1.conf

■ Click on “**Launch instance**” button

- Once the DistroTV Studio Transcoder AMI is launched, after 2-3 minutes, it will pick up the videos found in your **/transcode/new/** folder
- You can view the status of the database by accessing the API at **http://<IPv4_ADDRESS_OF_YOUR_DISTROTV_STUDIO_MACHINE>:34123/?cmd=dblist**
 - HINT: **<IPv4_ADDRESS_OF_YOUR_DISTROTV_STUDIO_MACHINE>** should be your **DistroTV Studio image** IP address

Chapter 9. Create Channel Schedule

1. Download a Schedule File

- **IMPORTANT:** Please note the **current time in UTC** <https://www.utctime.net/>
- Create your schedule file by downloading one of the samples below according to the **current time in UTC**
 - If it is currently between hour 0 and 11:59:59 UTC then download **test_schedule_before12.tsv**
 - If it is currently between hour 12:00:00 and 23:59:59 UTC then download **test_schedule_after12.tsv**

UTC Time	00:00:00 – 11:59:59 UTC	12:00:00 – 23:59:59 UTC
Filename	test_schedule_before12.tsv	test_schedule_after12.tsv
Download Link	https://docs.distro.tv/samples/channel-builder/meta/schedule/myfirstchannel/test_schedule_before12.tsv	https://docs.distro.tv/samples/channel-builder/meta/schedule/myfirstchannel/test_schedule_after12.tsv

- The file you downloaded **does not** need to be modified

2. Create **myfirstchannel** Folder

- Navigate to your S3 bucket **/meta/schedule** folder
- Click on “**Create folder**” button
- Under “**Folder**” box “**Folder name**” section, name this “**myfirstchannel**”
 - If you kept the default filepath from the sample global conf file, the file directory path would be **s3://<bucket name>/meta/schedule/myfirstchannel**
- Click on “**Create folder**” button

3. Upload Your Schedule

- Navigate to the **myfirstchannel** folder you just created under **s3://<bucket name>/meta/schedule/myfirstchannel/**
- The file you downloaded **does not** need to be modified
- Upload the schedule TSV file to this folder

Chapter 10. Launch Your Channel

- Create a channel conf file by downloading the sample channel conf file below here:
<https://docs.distro.tv/samples/channel-builder/meta/channels/myfirstchannel.conf>
- Save as **myfirstchannel.conf**
- This channel conf file controls different channel parameters such as ad marker cadence, stream quality variants, ad filler videos, and more. You can find additional details in our **User Guide**.
- Check to ensure the sample videos have finished transcoding before proceeding with the next step
 - You can view the status of the database by accessing the API at
`http://<your-instance-public-IPv4>:34123/?cmd=dblist`
 - HINT: `<your-instance-public-IPv4>` should be your **DistroTV Studio image** IP address
 - Wait for the “status” of both the videos to be “complete” before proceeding with the next step
- Inside the `/meta/channels/` folder, upload the channel conf file you created **myfirstchannel.conf**
- After uploading, you can wait a few minutes to see if the channel was picked up by the machine by checking the watchdog API at:
`http://<your-instance-public-IPv4>:34123/?cmd=getlog&channel=watchdog&grep=`
- The initial channel EPG building from the provided schedule will begin progressing. You can see this occur within the channel API at:
`http://<your-instance-public-IPv4>:34123/?cmd=getlog&channel=myfirstchannel&grep=`
- If the schedule was properly picked up, it will say the below (or something similar)

```
cronjob started
processing (pgen) <name-of-schedule>.tsv
generating <name-of-schedule>.tsv
coding <name-of-schedule>.tsv
pcode: completed: /data/onramp/runtime/myfirstchannel/schedule/<name-of-schedule>.done
found tsv files: [ '<name-of-schedule>.tsv' ]
cronjob finished in n minutes
processing /data/onramp/runtime/myfirstchannel/schedule/<name-of-schedule>.done-
start time: YYYY-MM-DD HH:MM:SS
master playlist building complete.. (timestamp of when the schedule finished being built)
cronjob finished in 0.17 minutes
watchdog.py process not found, restarting...
v1.m3u8 doesnt exist, restarting...
cencoder init...
playlist changed: /data/onramp/runtime/myfirstchannel/schedule/<name-of-schedule>.done- start: YYYY-MM-DD HH:MM:SS / endt: YYYY-MM-DD HH:MM:SS
watchdog.py process not found, restarting...
```

- The master playlist building complete message marks the successful generation of the schedule and the EPG has been built.
- Once the EPG has been built, you can check the EPG in the **s3_meta** folder. If you kept the default filepath from the sample global conf file, the file directory path would be
 - **s3://<bucket name>/meta/epg/myfirstchannel/<datetimestamp>/**
- You can also check to see if files have begun to populate in your **s3_output** folder. If you kept the default filepath from the sample global conf file, the file directory path would be **s3://<bucket name>/strm/channels/myfirstchannel/**
- When the built schedule is active, you will be able to view your channel at **https://<bucket name>.s3.<region>.amazonaws.com/strm/channels/myfirstchannel/master.m3u8**
 - Replace **<bucket name>** with your bucket name
 - Replace **<region>** with your S3 bucket region
- Congratulations on launching your first channel!

After all chapters, your S3 bucket should have the following structure:

```

<bucket-name>/
├── content/                                (Created as per Chapter 5)
│   └── test_category_metadata.tsv          (Uploaded as per Chapter 7)
├── globals/                              (Created as per Chapter 4)
│   └── global_1.conf                      (Uploaded as per Chapter 4, referenced by EC2 instances)
├── meta/                                 (Created as per Chapter 5)
